

WORLD WATER DAY

Water is one of the reasons why life exists on Earth.

Naturally occurring waters can be divided into **fresh and salty**.

Freshwater covers the land like fishing nets.

Salt waters surround the lands around

Water is what makes our planet appear blue from space. Unfortunately, most of the water **on Earth is unfit for consumption** because it is salty.

The water cycle in nature allows life on our planet to continue and thrive.

WHY IS WATER IMPORTANT TO US?

In a **temperate climate**, a person can survive without water for **4 to 7 days**, depending on health, age, gender and other individual predispositions.

We use water at home:

- for cooking
- washing
- cleaning
- bathing
- washing the car
- watering flowers

We also use water in industry and agriculture.

SO HOW CAN WE TAKE CARE OF WATER?
**Here are some ideas, but it's not a
complete list!**

If you can, **take a quick shower** instead of a bath!

When you wash your hands, **the water stream does not have to flow at maximum force.**

Remember, you don't have to flush the entire toilet every time. A toilet usually **has two buttons**: a smaller one and a larger one!

Only turn on the **dishwasher and washing machine** when they are full.

Do not **wash dishes under running water.**

Don't throw away water if you can use it, for example, to water flowers, garden or for cleaning.

Fix **dripping taps!**
