

How can you save energy?

☐

RADIATORS: Pay attention to what is around them. Move the sofa or other furniture away from the radiator – they prevent the room from heating up.

☐

LIGHT: Are you leaving the room? Turn off the lights!

☐

ENERGY-SAVING BULBS: Use them everywhere! Replacing light bulbs with new energy-saving light sources is an investment that pays off for the whole family.

☐

HARDWARE: If you have been playing on your PC, laptop, or Playstation and forgot to turn them off afterward, do it now!

☐

NO DUST: Wipe dust off radiators. They will give off more heat to the room.

☐

CHARGERS: Remove chargers from sockets, they use energy too.

☐

WINDOWS: Feeling the cool breeze coming from your windows? Sealing them is a great way to save money too!

☐

HEAT AT NIGHT: Lower the temperature of the radiator at night or when you are not at home.

☐

VENTILATION: When ventilating in winter, open the window or door as wide as possible for a short time – 2–3 minutes. Turn off the heat for that moment. Do not leave a slightly open window for a long time – you will waste energy.

☐

THERMOSTAT: Install thermostats – knobs that regulate the heat of the radiator.

☐

“NO” FOR A SILVER RADIATOR: Replace all silver radiators with plain white ones. Silver does not give off heat to the outside.

☐

ALTERNATIVE ENERGY SOURCES: Have you done all of the above? Time to use alternative energy sources: (e.g. install photovoltaic panels on the roof of the building where you live).
